Entrance Examination Board

ABSTRACT

The College Entrance Examination Board Foreign Language Placement Tests were normed on students enrolled in French, German, Russian, and Spanish courses during Fall semester, 1969. Differences between performance at the four levels of each course were also investigated and comparisons made among CEEB test scores, course grades, and CEEB standard score norms. Results indicated that students enrolled in the first four courses of a foreign language have learned significantly different amounts of the same material as measured by the Placement Tests. However, if results are inspected at the same course, level by looking at the standard scores, it appears that the level of performance is about the same for each language. An accurate check on this was not possible as different tests were used for each language. In general, students enrolled in lower level courses fell below the national norm average while those in upper levels were above. Relationships between test scores and course grades indicated that test scores can be used to identify successful performance almost as well as grades. Therefore, cut-off scores were established using the average reading and listening test standard scores for placement into and proficiency in the various courses studied. (Author/AG)

Abstract

The purpose of the present study was to norm the College Entrance Examination Board (CEEB) Foreign Language Placement Tests on students enrolled in French, German, Russian, and Spanish courses during Fall semester, 1969. In addition, differences between student performance at the four levels of each course were investigated and comparisons were made between CEEB test scores, course grades, and CEEB standard score norms.

The results indicate that students who are enrolled in the first four courses of a foreign language have learned significantly different amounts of the same material as measured by the CEEB Foreign Language Placement Tests. However, if results for the four languages studied are inspected at the same course level by looking at the standard scores, it appears that the level of performance is about the same for each of the foreign languages. An accurate test of this latter comment was not possible as different tests were used for each of the foreign languages.

In general, the students enrolled in the lower level courses (101 and 102) fell below the national norm average on the CEEB tests while those in the upper levels (103 and 104) were above the norm average.

The relationships between the test scores and course grades indicated that the test scores can be used to identify successful student performance almost as well as the grades. As a result of this information, CEEB test cut-off scores were established using the average reading and listening test standard scores for placement into and proficiency of the various courses studied.

A Study of Foreign Language Learning at the University
of Illinois Using the CEEB Foreign Language Placement
Tests and End-of-Course Grades

INTRODUCTION

The effectiveness of a placement and proficiency system and its instrumentation is contingent upon the appropriateness and currency of its normative data. If the bases for making judgements about what courses students should be placed in and what courses they should be granted proficiency credit for have not been updated for changes in course structure, teaching staff, and student abilities, then these bases may be impeding the students' ability to learn and in turn create unwarranted expenses to the university.

The purpose of the present study was to norm the College Entrance Examination Board (CEEB) Foreign Language Placement Tests on students enrolled in French, German, Russian, and Spanish courses during Fall semester, 1969. The reasons for norming the CEEB tests on these courses were that the Modern Language Association (MLA) - Cooperative Foreign Language Tests (1) had last been normed for these courses in 1964-65 (Spencer, 1965) and (2) only consist of two forms which have not been revised since that time. The CEEB tests, on the other hand, provide new revised forms about every six months and, therefore, provide a more secure test.

In order to accurately place incoming freshmen into a four semester foreign language course, one must first obtain an adequate description of the achievement levels of the students enrolled. Then, using similar

descriptions on incoming freshmen, determine which semester course is the most appropriate. Also, these comparisons could be used to determine whether or not proficiency credit should be granted.

The achievement level description will consist of: (a) final grade in the course, (b) score on the CEEB reading test, and (c) score on the CEEB listening test.

The specific objectives of the study were, therefore, to:

- 1. Determine what differences exist between students enrolled in the 101, 102, 103, and 104 foreign language courses as measured by the CEEB Foreign Language Placement Tests.
- 2. Determine the degree of relationship between the CEEB test scores and grades received in the various courses.
- 3. Specify what the appropriate cut-off scores would be for differential placement and proficiency of incoming freshmen into the foreign language courses studied.
- 4. See how well the students enrolled in these courses compared to the national norms characterized by the CEEB standard score equivalent to the raw score.

POPULATION

The descriptive population for this study was comprised of students who were enrolled in the following courses during the Fall semester, 1969.

Course			N
French	101 102 103 104		355 196 279 127
		Tota	1 957
German	101 102 103 104		323 117 238 <u>54</u>
		Tota	1 732

3.

Course				<u>N</u>
Russian	101 102 103 104			70 19 41 10
		Т	otal	140
Spanish	101 102 103 104	m	1-4-7	253 133 161 64
		T	otal	611

METHOD

The CEEB Foreign Language Tests were administered to the groups listed above in January, 1970. For each of the languages, the testing program consisted of two parts: Reading and Listening. Within each language the identical test forms were used at all levels. The forms used are indicated below with number of items enclosed in parentheses:

Language	Reading	Test Time	Listening	Test Time
French	NPL2 (95)	60 minutes 60 minutes 60 minutes 60 minutes	NPL (47)	30 minutes
German	QPL1 (92)		PPL1 (54)	30 minutes
Russian	PPL1 (85)		PPL (54)	30 minutes
Spanish	PPL1 (92)		NPL (60)	30 minutes

In attempting to make interpretations of the results of this study, it is necessary to bear in mind that differences among languages, or among language levels, may be attributed to a multiplicity of factors. Such factors include the following:

- 1. Different individual placement procedures within each department beyond the MLA test scores.
- 2. Varying levels of high school language experience.
- 3. Different requirements for the various ${\tt University}$ curricula or colleges.

- 4. Different ability levels among students which may be nonrandomly associated with different languages.
- 5. Different language laboratory usage in terms of attendance, the nature of the language lab programs, and whether or not the language lab was required.
- 6. Different instructional programs, instructors, text books, hours of instruction time, etc.

Thus, one should be cognizant of these potential sources of difficulty when interpreting the results.

RESULTS OF FALL SEMESTER, 1969, TESTING

CEEB Norm Comparisons

One useful piece of information in a validation study is the comparison of local results with those of the norm populations on which the tests were standardized. For the present study, mean scores were compared with standardized scores on the CEEB score scales. The CEEB scales contain scores which range from 200 to 800 and were originally set so that a typical group of college applicants would average around 500, with approximately two-thirds scoring between 400 and 600 (that is, the standard deviation was 100).

Shown in Table 1 are the mean raw scores of the reading and listening tests for all languages and their equivalent CEEB standard scores. It can be seen that for each of the four languages the reading score means for levels 101 and 102 are below the CEEB mean while those for levels 103 and 104 are above the CEEB mean.

Similar observations are made for the listening score means for French,

German and Spanish. However, for Russian the listening mean score for levels

101, 102 and 103 fall below the CEEB means.

Table 1. Standard Score Equivalents of U. of I. Mean Scores for Foreign Language Classes - January, 1970

		U. of I. Mean (Raw Score)	CEEB Standard Score	U. of I. Mean (Raw Score)	CEEB Standard Score
French	101	9.78	425	7.37	444

	104	28.72	576	24.36	538

6.

As was observed in an earlier study (Spencer, 1965), the listening test results yielded lower norm comparisons than the reading, especially for the 103 and 104 courses. This seems to indicate that there still is more emphasis on reading comprehension in the second year of foreign language learning than in the first year.

Differences Among Courses of Each Language

In order to determine whether or not the four courses in each language differed significantly in their mean scores, an analysis of variance (ANOVA) was run using the two-digit CEEB standard scores. The standard score mean test results and course grades are shown in Table 2 and the F-ratios are reported in Table 3. The results of the Newman-Keuls test are presented in Table 4.

Summary of the Newman-Keuls test for each language is as follows:

French

Reading: All mean-pair differences are significant at α = .01 level.

Listening: (same as above)

Average: (same as above)

German

Reading: All mean-pair differences are significant at α = .01 level.

Listening: (same as above)

Average: (same as above)

Russian

Reading: Mean-pair difference between 103 and 104 is not significant at α = .05. All other mean-pair differences are significant at $\dot{\alpha}$ = .01 level.

16.

Listening: Mean-pair differences between 101 and 102 and between 103 and 104 are not significant at α = .05 level. Mean-pair difference between 102 and 103 is significant at α = .05 level. The remaining mean-pair differences are significant at α = .01 level.

Average: Mean-pair difference between 103 and 104 is not significant at α = .05 level. The remaining mean-pair differences are significant at α = .01 level.

Spanish

Reading: All mean-pair differences are significant at α = .01 level.

Listening: (same as above)

Average: (same as above)

In French, German, and Spanish, each course was significantly different and in the expected direction, indicating that the higher scores were obtained by the upper level students. In Russian, however, a consistent finding of no significant difference between 103 and 104 in reading, listening, and average scores was observed.

After looking at each of the foreign languages with respect to the Newman-Keuls test results, the following observations can be made:

- 1. The mean scores for the French, German, and Spanish 101-104 courses were significantly different (α = .01) indicating that as one goes from 101 to 104 there is a significant increase in French, German, and Spanish reading and listening knowledge.
- 2. The mean scores in Russian were not as easy to interpret since several non-significant results were noted. If one looks at the average reading and listening score comparisons, however, the only courses not significantly different are 103 and 104 which could be attributed to the small number of students tested.

Correlations

Table 5 contains the intercorrelations among the reading, listening, and average standard scores, and grades for each of the languages. The average

score with grade correlations indicate that we are maintaining the same sense of discrimination as would be achieved if we had only used the reading test results.

The correlations also indicate that, except for French 101 and Spanish 104, reading scores correlate higher with course grades than do listening scores. Perhaps this is indicative of instructors placing greater emphasis on the reading aspect of foreign language learning as opposed to the oral-aural aspect. The relatively high correlations indicate that the test scores can be used to discriminate among the students in each course similar to the grading pattern.

The correlations between the reading and listening scores seem to provide evidence of both a significant relationship between the reading and listening tests and, at the same time, a uniqueness between them. This is precisely what is needed as we are interested in measuring different aspects of language knowledge.

Multiple correlations of reading and listening scores on course grade are given in Table 6 for all languages. If we compare these multiple correlations to the average score-grade correlations, it is obvious that very little predictive power is gained by using the multiple correlations. In fact, only the Russian 103 and 104 courses seem to have largely different coefficients but they still only account for 2% more of the predictable variance.

Reliabilities

Reliabilities of the foreign language tests are given in Table 7 and indicate that these tests in fact are very reliable.

University of Illinois Percentile Norm Tables

The University of Illinois percentile norms for the CEEB reading and listening tests are presented in Table 8. Looking at each course level over the four languages it is obvious that the distributions are quite similar indicating that the students appear to be learning about the same amount of material.

Distribution of Grades on Standard Scores

Table 9 shows what the distribution of grades for each course would look like plotted on the CEEB average standard score base. If lines are drawn through these distributions representing the CEEB score mean, it is apparent that at each course level the higher course grades fall above that mean line. In fact, in most courses, it represents the point at which grades of D and E fall below. Therefore, two sets of tables were generated, one (Table 10) containing cut-off scores generated by the mean CEEB score at each course level and the other (Table 11), containing cut-off scores generated by the point at which D and E grades no longer appeared. The resulting tables are very similar.

Using Table 10 as the basis for our cut-off placement scheme we are saying that an incoming freshman who achieves a score below the mean CEEB score of a particular course will be placed into that course. If he achieves a score above that mean he will be placed into the next higher level. With the exception of Russian all the placement cut-off tables followed the mean lines of the CEEB scores. Due to the small number of students and the closeness of the mean values for the Russian 103 and 104 courses, the 104 cut-off score was raised to 55 so as to match those of the other larger language groups.

The proficiency scheme previously used (Aleamoni and Spencer, 1968) will be retained. The scheme assumed that one year of high school study was equivalent to one semester of college study. Therefore, students would normally be placed as follows:

Years of High School Study	Normal Placement
0	101
1	102
2	103
3	104
4	Beyond 104

Students who place beyond this normal placement, based on their average reading and listening standard scores will be given proficiency credit for each course skipped up to a maximum of four courses.

Graphic Representation of Test Results

Table 12 is a graphic representation of the Foreign Language test results using Reading and Listening raw scores. For each course, the mean, standard deviation and range are indicated. The mean is represented by the line that divides the rectangle. The standard deviation is the score point distance from the mean to the end of the rectangle. The range is designated by the scores at the end of the arrows for each rectangle.

SUMMARY

The results of the present study indicate that students who are enrolled in the first four courses of a foreign language have learned significantly different amounts of the same material as measured by the CEEB Foreign Language Placement Tests. However, if results for the four languages studied are inspected at the same course level by looking at the standard scores, it

Table 12. Graphic Representation of Foreign Language Test Results

-10

41.

appears that the level of performance is about the same for each of the foreign languages. An accurate test of this latter comment was not possible as different tests were used for each of the foreign languages.

In general, the students enrolled in the lower level courses (101 and 102) fell below the national norm average on the CEEB tests while those in the upper levels (103 and 104) were above the norm average.

The relationships between the test scores and course grades indicated that the test scores can be used to identify successful student performance almost as well as the grades. As a result of this information CEEB test cut-off scores were established using the average reading and listening test standard scores for placement into and proficiency of the various courses studied.
